MANUFACTURED HOUSING COMMUNITIES & RV PARKS

Texas-Focused Investment Thesis

Acquisition strategy, operating thesis, underwriting framework, risk controls, and supporting company reports

PREPARED FOR	**Ken Chandler**
PREPARED BY	Investment Strategy Report
DATE	July 15, 2026
PRIMARY GEOGRAPHY	Texas secondary and tertiary markets

Investment conclusion

Build the platform around manufactured housing communities for recurring land-rent durability, then add selectively acquired hybrid RV parks for higher operating upside. Avoid assets where utility, flood, insurance, or transient-demand exposure can overwhelm the NOI growth plan.

01 Executive Summary

CORE INVESTMENT THESIS

Acquire under-managed manufactured housing communities and hybrid RV parks in Texas markets where housing affordability supports demand, new pad supply is difficult to create, and operational improvements can materially increase recurring NOI.

The recommended platform is not a single blended property type. Manufactured housing communities (MHCs) are primarily residential land-lease investments with unusually low physical home turnover. RV parks are operating businesses with real estate underneath them, requiring hospitality-level pricing, marketing, and guest service. The strategy should therefore use MHCs as the portfolio's defensive core and RV parks as a selective return enhancer.

97.7%	0.3%	6.4%	-2.2%
Sun same-property MH occupancy, 1Q26	Average annual physical MH move-outs	Sun 10-year avg. same-property NOI growth	2026 transient campground bookings YoY
Source [1]	Source [1]	Source [1]	Source [8]

Public-company evidence supports the residential land-lease thesis. Sun Communities reported 97.7% same-property MH occupancy at March 31, 2026, five-year average occupancy of 97.6%, and annual physical home move-outs averaging only 0.3%. Its 10-year average MH site-rent growth was 4.4%, while North American MH/RV same-property NOI growth averaged 6.4%. [1]

The RV evidence is positive but more cyclical. KOA reported that more than 52 million North American households camped in 2025, generating an estimated $66 billion economic footprint. At the same time, the RV Industry Association lowered its 2026 wholesale shipment forecast to a 314,000-unit midpoint, 8.2% below 2025, and Campspot reported 2026 median same-store site nights down 1.2% with transient bookings down 2.2%. [6][7][8]

Recommended allocation	Role in portfolio	Primary return engine	Risk profile
70% MHC equity	Defensive core	Lot-rent growth, occupancy, infill, utility recapture	Lower operating volatility; infrastructure and regulatory risk
30% RV equity	Selective upside sleeve	Dynamic pricing, extended stay, annual sites, ancillary revenue	Higher seasonality, weather, marketing, and execution risk

Investment mandate

- Acquire 75- to 300-site communities with existing cash flow and at least two identifiable NOI levers.
- Favor resident-owned-home MHCs; use rental homes tactically rather than allowing them to dominate invested capital.
- For RV, prioritize hybrid parks where monthly and annual revenue covers fixed operating costs and most debt service.
- Reject assets with unresolved wastewater, floodway, electrical-capacity, title, zoning, or insurance problems regardless of headline cap rate.
- Underwrite to a base case that does not require aggressive rent increases, pandemic-level transient demand, or a quick refinance.

02 Evidence from Public Operators and Industry Reports

The investment case is strongest when the thesis is separated into durable structural evidence, controllable value-creation levers, and current cyclical risks. The table below summarizes the most decision-relevant findings from public operators and current industry reports.

Source	Type	Reported evidence	Investment implication	Ref.
Sun Communities	MH/RV operator	97.7% MH occupancy; 0.3% annual move-outs; 4.4% 10-year MH site-rent growth; 6.4% 10-year same-property NOI growth.	Supports sticky-resident, recurring-rent thesis.	[1]
Equity LifeStyle Properties	MH/RV operator	2025 core MH base rent +5.5% on 5.8% rate growth; average core MH occupancy 94.3%. Annual RV revenue +4.1%, but seasonal -9.9% and transient -8.5%.	Favor annual/extended-stay RV revenue over transient concentration.	[2]
UMH Properties	Value-add MHC operator	2025 same-property NOI +9%; same-property occupancy rose 80 bps. Expansion sites estimated at about $75,000 per homesite and expected to yield more than acquisition opportunities once stabilized.	Validates infill, expansion, and operational turnaround strategy.	[3]
PGIM Real Estate	Institutional research	MHC NOI growth has been positive and comparatively stable through economic cycles; relocation barriers produce sticky tenants.	Supports defensive allocation and long hold periods.	[4]
IPA / Marcus & Millichap	Market research	National MHC vacancy was 5.2% entering 2025; few communities are being developed due to zoning and regulatory constraints.	Supply scarcity supports occupancy and pricing power.	[5]
KOA	Camping research	More than 52 million North American households camped in 2025; estimated $66 billion economic footprint.	Confirms a large outdoor-hospitality demand base.	[6]
RVIA	RV industry forecast	2026 RV shipments forecast midpoint of 314,000, down 8.2% from 2025 amid financing and household-budget pressure.	Underwrite RV demand conservatively; avoid relying on new RV sales.	[7]
Campspot	Operating-data platform	Jan-May 2026 median same-store site nights -1.2%; transient bookings -2.2%; glamping resorts +10.9%.	Current softness favors differentiated parks and recurring revenue.	[8]
Texas MHA	Texas production data	2026 YTD Texas shipments were 4.3% below 2025; Texas plant production was down 11.2%.	Build delivery timing and home-cost contingencies into infill plans.	[10]

What the public-company evidence does not prove

REIT performance should not be copied directly into private-property underwriting. Public operators benefit from portfolio scale, purchasing power, access to capital, specialized systems, and geographic diversification. Their reported results establish that the business models can produce attractive recurring growth; they do not establish that any individual acquisition is safe or appropriately priced.

> UNDERWRITING DISCIPLINE
>
> **Use public-company results as an operating benchmark, not as a substitute for property-level utility, zoning, flood, market-rent, and capital-needs diligence.**

03 Manufactured Housing Community Thesis

Why MHCs should be the defensive core

The resident typically owns the home while the community owner controls the land, roads, utilities, and common areas. Because manufactured homes are rarely moved after installation, residents are economically and logistically anchored to the community. Sun’s reported 0.3% annual physical home move-outs and PGIM’s description of sticky tenants support the durability of the land-rent stream. [1][4]

Supply is constrained at the community level. IPA reported national MHC vacancy of 5.2% entering 2025 and noted that only a handful of communities were under development. Sun describes new MH supply as virtually nonexistent within its market comparison. [1][5]

The MHC thesis is therefore not simply “affordable housing.” It is the ownership of scarce, entitled residential pads with high resident retention and multiple controllable NOI levers.

Target acquisition profile

Criterion	Target	Reason
Community size	75-300 pads	Enough scale for professional management without limiting the buyer universe to institutions.
Physical occupancy	70%-95%	Creates measurable upside without requiring a complete turnaround.
Resident-owned homes	Prefer 75%+	Reduces recurring home capex and preserves land-lease characteristics.
Vacant-pad / expansion potential	10+ pads or entitled excess land	Supports internal growth independent of cap-rate compression.
Utilities	Municipal preferred; submeterable systems	Limits catastrophic plant risk and supports utility recovery.
Market demand	Workforce, retiree, industrial, medical, or cross-border employment	Diversifies resident demand beyond a single employer.
Base-case DSCR	1.35x minimum	Protects against capex and rate volatility.
Levered return target	15%+ IRR; 8%+ stabilized cash-on-cash	Requires real value creation rather than financial engineering.

Primary value-creation levers

- Pad infill: place new or quality used homes on vacant pads and rent, sell, or finance them according to local demand and capital availability.
- Expansion: extend roads and utilities onto entitled excess land where existing amenities and staffing can support additional sites.
- Utility recapture: repair leaks, install submeters, and implement lawful resident reimbursement with transparent billing.

- Rent normalization: move below-market rents through predictable annual increases rather than abrupt resets that increase political and collection risk.
- Collections and lease enforcement: convert informal operations into written standards, online payments, consistent notices, and documented resident communication.
- Curb appeal and resident pride: improve roads, drainage, lighting, signage, landscaping, and site standards to support retention and new-home sales.

Rental-home policy

UMH demonstrates that rental homes can accelerate occupancy: it reported approximately 10,900 rental homes at 93.8% occupancy at year-end 2025. It also reported rental homes representing approximately 41% of its homesites, illustrating the capital intensity that can develop when rentals become a major business line. [3]

Recommended policy: use rental homes tactically to fill pads and prove demand, but cap rental-home cost basis and separately track home-level return on cost. The community should remain an appreciating land-and-infrastructure investment rather than becoming an apartment portfolio composed of depreciating homes.

04 RV Park Thesis

Why RV parks remain investable

The long-term demand base remains broad. Sun estimates approximately 8.1 million RV-owning households versus roughly 1.7 million RV campsites in the United States, while KOA reported more than 52 million camping households in 2025. [1][6]

However, 2026 data require a conservative posture. RVIA lowered its shipment forecast, Campspot reported softening same-store site nights and transient bookings, and ELS reported 2025 declines in seasonal and transient RV revenue despite growth in annual RV revenue. [2][7][8]

> RECOMMENDED RV MODEL
>
> **Acquire hybrid parks where monthly and annual residents provide the recurring revenue floor and transient demand provides upside. Do not buy a commodity transient park based on peak-season revenue alone.**

Recommended site mix

Revenue segment	Target mix	Purpose
Monthly / extended stay	40%-60%	Covers payroll, utilities, recurring operating costs, and a substantial portion of debt service.
Annual / seasonal	15%-25%	Creates renewal visibility and lowers customer acquisition cost.
Nightly / weekly	20%-40%	Captures event, holiday, weekend, and destination pricing upside.
Cabins / park models	0%-10%	Selective higher-rate product; only where demand supports operating and maintenance complexity.

Target acquisition profile

Criterion	Target	Reason
Park size	80-250 sites	Supports professional staffing and revenue management.

Criterion	Target	Reason
Trailing occupancy	60%+ with documented upside	Avoids ground-up demand risk.
Demand drivers	At least three	Examples: contractors, retirees, medical, industrial, events, destination travel, university, or military.
Utility infrastructure	30/50 amp; reliable water; verified wastewater capacity	Electrical and wastewater failures can eliminate multiple years of projected return.
Recurring revenue coverage	Monthly/annual revenue covers fixed opex	Reduces dependence on weather and online transient demand.
Base-case DSCR	1.40x minimum	Reflects higher revenue volatility than MHCs.
Levered return target	18%+ IRR; 10%+ stabilized cash-on-cash	Compensates for hospitality and execution risk.

RV revenue-management levers

- Dynamic pricing by day of week, season, event, site type, and remaining inventory.
- Premium rates for pull-through, oversized, shaded, waterfront, concrete, or private-yard sites.
- Monthly utility reimbursement with accurate metering and clear lease language.
- RV/boat storage, laundry, propane, upgraded Wi-Fi, vending, pet fees, and site-lock fees.
- Corporate agreements with construction, industrial, medical, and infrastructure employers.
- Direct-booking and repeat-guest programs that reduce reliance on third-party channels.

05 Texas Platform Strategy

Recommended portfolio construction

The platform should be built sequentially. First, acquire MHCs that can establish recurring cash flow and a repeatable operating system. Second, add hybrid RV parks only after revenue management, marketing, and on-site staffing capabilities are in place. Third, aggregate assets by operating corridor so maintenance, procurement, leasing, and management resources can be shared.

Phase	Capital priority	Operating objective	Go / no-go test
Phase I: Base	MHC acquisitions and infill	Create dependable recurring lot rent and standardize operations.	Property-level utilities, title, zoning, and drainage fully understood.
Phase II: Cluster	Nearby MHC or hybrid RV acquisitions	Build purchasing, staffing, and marketing density.	Regional manager and maintenance capacity can absorb the asset.
Phase III: Scale	Larger expansions and selective development	Generate internal growth at yields above acquisition opportunities.	Entitlements, capacity, phasing, and home-delivery pipeline are documented.

Texas market filters

The following filters are recommendations for sourcing and underwriting; they are not a claim that every property in the listed corridor is attractive.

- South Texas / Rio Grande Valley: workforce, cross-border, retiree, and Winter Texan demand; require disciplined flood, drainage, heat, and utility diligence.
- San Antonio and I-35 outer-ring markets: target employment and population corridors where affordable housing alternatives remain relevant, but avoid overpaying for growth narratives.
- DFW secondary and tertiary markets: prioritize industrial, logistics, construction, military, medical, and education demand rather than destination-dependent RV parks.

- Gulf Coast and Hill Country: only pursue RV assets with documented elevation, flood history, evacuation planning, warning systems, and insurable business-interruption exposure.
- Industrial and infrastructure nodes: extended-stay RV demand can be strong, but underwriting must include employer concentration, project-completion dates, and alternate demand sources.

Texas manufactured-home supply caution

Texas Manufactured Housing Association data showed 2026 year-to-date home shipments 4.3% below 2025 and Texas plant production 11.2% below the prior year. The immediate implication is not necessarily weak park demand; it is that infill schedules should include home-order lead times, manufacturer concentration, transportation, setup, skirting, HVAC, utility connection, and financing contingencies. [10]

> PLATFORM MOAT
>
> **The competitive advantage should be execution: sourcing off-market assets, accurately diagnosing infrastructure, placing homes faster, standardizing resident operations, and building regional operating density.**

06 Underwriting Framework and Return Controls

Base-case underwriting principles

- Use trailing actual collections, not scheduled rent, as the starting revenue base.
- Separate lot rent, home rent, utilities, storage, late fees, and other income so each revenue stream can be independently tested.
- Underwrite property taxes to the post-sale basis and insurance to a current broker indication, including named-storm, flood, and business-interruption limitations.
- Do not credit vacant pads at stabilized value until utility capacity, home placement cost, demand, timing, and financing are validated.
- Model recurring infrastructure reserves separately from cosmetic capital improvements.
- Use an exit cap rate at least 50-100 basis points above the going-in market assumption unless the asset is demonstrably de-risked and institutionalized.
- Size debt to downside DSCR, not maximum lender proceeds.

Minimum downside tests

Stress case	MHC test	RV test	Required response
Revenue	Occupancy -300 bps; rent growth reduced by 50%	Transient revenue -15%; monthly occupancy -500 bps	DSCR remains above 1.15x and working capital remains positive.
Expenses	Utilities +15%; insurance +20%; taxes at reassessed basis	Payroll +10%; utilities +15%; insurance +25%	No dependence on fee income to service debt.
Capex	Immediate water/sewer/road reserve	Electrical, septic/wastewater, roads, Wi-Fi reserve	Capital plan fully funded at closing or through committed facility.
Exit	Exit cap +100 bps	Exit cap +125 bps	Equity remains positive with acceptable hold-period return.
Timing	Infill delayed 12 months	Seasonal ramp delayed one year	Acquisition remains financeable without emergency equity.

Investment committee approval gates

Gate	Required evidence
Legal / title	Zoning and legal use confirmed; site count reconciled; easements, access, leases, licenses, and park rules reviewed.

Gate	Required evidence
Utilities	Water, sewer/septic, electric, gas, wells, and treatment systems inspected; capacity and compliance confirmed.
Flood / drainage	FEMA and local flood data, historical loss information, drainage inspection, elevation, and emergency planning reviewed.
Market	Competitive set, achieved rents, lead data, employer base, new supply, home sales, and resident/guest demand validated.
Operations	Payroll plan, software, marketing, collections, resident communication, and maintenance coverage documented.
Capital	Three-year capital plan, immediate repair budget, reserve policy, and home-placement budget approved.
Financing	Base and downside DSCR, extension options, covenants, recourse, prepayment, and refinance assumptions understood.

07 Risk Matrix and Mitigation Plan

Risk	MHC	RV	Mitigation
Wastewater / septic failure	High	High	Third-party inspection, capacity test, compliance review, replacement reserve, and seller escrow where uncertainty remains.
Flood and severe weather	High	High	Elevation and drainage review, historical claims, evacuation plan, warning system, insurance sublimit review, and business-interruption coverage.
Electrical capacity	Medium	High	Load study, pedestal inspection, transformer/service review, and phased upgrade budget.
Rent / resident regulation	Medium	Low-Med.	Local counsel review, reasonable rent policy, documented capital improvements, and strong resident communication.
Rental-home concentration	Medium-High	N/A	Separate home-level P&L, return-on-cost hurdle, inventory controls, and portfolio concentration cap.
Transient demand volatility	N/A	High	Recurring monthly/annual base, dynamic pricing, diverse demand drivers, and conservative peak-season assumptions.
Insurance cost / availability	Medium-High	High	Obtain indications before final pricing; model deductibles, exclusions, coinsurance, and replacement-cost gaps.
Deferred roads / drainage	High	Medium-High	Civil inspection, phased capital plan, resident-impact schedule, and contingency.
Management execution	Medium	High	Cluster strategy, defined KPIs, regional oversight, revenue management, training, and weekly operating cadence.

Risk	MHC	RV	Mitigation
Home delivery and setup	Medium	Low	Multiple manufacturers/installers, fixed scopes, permits, transportation checks, and delivery contingency.

Red flags requiring a price reset or rejection

- The seller cannot reconcile legal site count to the rent roll, utility map, and municipal approvals.
- Private wastewater capacity or compliance cannot be verified before the end of diligence.
- The property is in a floodway or has repeated losses without a credible engineering and insurance solution.
- The business plan depends on immediate double-digit rent increases to meet debt service.
- RV underwriting relies on one employer, one event, one season, or one online booking channel.
- Insurance cannot be bound at the underwritten premium and deductible.
- The acquisition requires refinancing or sale within two years to achieve an acceptable return.
- Deferred infrastructure exceeds the sponsor’s available liquidity and committed capital.

08 100-Day Acquisition and Operating Plan

Timing	Workstream	Required actions
Pre-LOI	Screening	Verify zoning/use, flood exposure, site count, utilities, collections, occupancy, tax basis, insurance range, and immediate capex.
LOI to day 15	Diligence launch	Order survey/title, utility inspections, property-condition review, environmental, market study, rent audit, and legal review.
Days 15-30	Underwriting reset	Replace seller assumptions with verified collections, operating costs, capital plan, and realistic infill/occupancy timing.
Days 30-45	Financing and IC	Lock lender terms, complete downside cases, approve operating plan, and negotiate credits/escrows or re-trade.
Closing to day 30	Control	Banking, software, resident/guest communications, staffing, vendor controls, collections, insurance, and emergency procedures.
Days 31-60	Stabilize	Repair health/safety items, implement site standards, launch marketing, meter audit, pricing matrix, and lead tracking.
Days 61-100	Create value	Begin infill/expansion design, utility recovery, renewal program, ancillary revenue, capex procurement, and KPI reporting.

Weekly KPI dashboard

MHC KPIs	RV KPIs	Shared capital / risk KPIs
Physical and economic occupancy	Site nights by segment	Cash balance and 13-week cash forecast
Collections and delinquency	ADR and RevPAS	Capex committed vs. spent
Renewals and notices	Monthly / annual renewal rate	Open life-safety and compliance items
Vacant pads and home pipeline	Transient booking pace and cancellations	Utility usage and recovery

MHC KPIs	RV KPIs	Shared capital / risk KPIs
Lot rent vs. market	Channel mix and direct bookings	Insurance claims and incidents
Rental-home occupancy and ROI	Ancillary revenue per occupied site	Debt service and covenant headroom

OPERATING STANDARD

Every acquisition must produce a property-level business plan, a three-year capital plan, a weekly KPI dashboard, and a documented downside response plan before closing.

09 Investment Committee Conclusion

The most defensible strategy is to build a Texas platform around scarce residential pads and recurring land rent, using manufactured housing communities as the core allocation. Public operators demonstrate high occupancy, low physical move-outs, sustained rent growth, and repeatable NOI expansion. Independent institutional research supports the same conclusion: limited new community supply and the difficulty of moving homes create durable cash flow. [1][4][5]

RV parks can increase portfolio returns, but only when acquired as operating businesses with diversified demand and a recurring revenue floor. Current 2026 shipment and campground data show that consumer and transient demand can soften even while long-term camping participation remains large. The proper response is not to avoid RV parks; it is to buy hybrid assets, underwrite transient revenue conservatively, and demand a higher return threshold. [2][6][7][8]

The decisive risks are not the headline cap rate or rent-growth story. They are infrastructure, flood exposure, insurance, site legality, management execution, and the amount of sponsor liquidity available after closing. The platform should reject any transaction where these risks cannot be clearly quantified, contractually allocated, and fully funded.

FINAL RECOMMENDATION

Target a 70% MHC / 30% hybrid RV equity allocation. Acquire operationally improvable assets with existing cash flow, expansion or infill potential, and verifiable utility capacity. Scale by geographic cluster, not by property count alone.

Immediate next action

Build a standardized acquisition scorecard and underwriting model using the criteria in this report. Every broker package should be screened through the same site-count, utility, flood, recurring-revenue, capex, DSCR, and value-creation gates before management time or third-party diligence dollars are committed.

A Acquisition Due-Diligence Checklist

Workstream	Documents and verification
Property / legal	Current survey; title; zoning; certificate or license; legal site count; access; easements; encroachments; park rules; resident agreements; permits.
Rent roll / revenue	Executed leases; deposits; concessions; delinquency; bad debt; home ownership; utility charges; storage; ancillary income; seasonal deposits.
Utilities	Water source; sewer/septic; treatment permits; capacity; submeters; leaks; electric service; transformers; pedestals; gas; trash contracts.
Physical	Roads; drainage; lighting; signage; common buildings; pools; trees; retaining walls; roofs; foundations; ADA; life safety.
MHC homes	Title status; home age; condition; rent vs. resident owned; inventory; liens; setup permits; skirting; HVAC; chattel financing.
RV operations	Site dimensions; 30/50 amp; pull-through mix; reservation system; booking pace; cancellations; channel mix; ADR; RevPAS; Wi-Fi.
Environmental / flood	Phase I; wetlands; floodplain/floodway; historical flooding; elevation; drainage; tanks; mold; emergency plan; warning systems.
Market	Competitive parks; achieved rents; home sales; employment; population; employers; construction projects; seasonality; future supply.
Financial	Three years P&L; bank statements; tax returns; utility bills; payroll; insurance claims; real-estate taxes; capex history; vendor contracts.
Insurance	Property; GL; umbrella; flood; wind/hail; named storm; business interruption; deductibles; sublimits; replacement cost; exclusions.
Operations	Staff roster; compensation; housing; vendors; licenses; software; marketing; resident complaints; code issues; litigation; incident logs.
Capital plan	Immediate repairs; 12-month plan; three-year plan; bids; contingencies; home orders; expansion engineering; permits; reserve funding.

B Source Reports and References

The following are the principal company filings and industry reports used to support the thesis. Public-company information is presented as reported by the source and should be reconciled to the latest filing before use in a live investment memorandum.
